Reflection on ANCT Outbound Trip, 11 to 21 December 2014
Written by Joram David Goh, Diploma in Architecture, Year 3

In Japan, the buildings are designed to withstand earthquakes and other natural disasters. The windows and structure is twice as strong and support with extra beams to withstand earthquakes. There are also insulators and absorbers to withstand the impact. Unlike Singapore, we do not worry about natural disasters. As an architecture student, I'm very intrigued by the Japanese architecture.

In Japan, it is difficult to find halal food, prayer rooms and mosques. Unlike Singapore, where we are racial harmonious, Japan does not meet the needs of the Muslims. As I met a Muslim girl from ANCT, I learned how she survived in the harsh Japan. Where she must buy food from an online store, and wait for about 2 days before her food can arrive. Learning the language and culture took her 2 years.
